

Task:

Develop a basic leave management module, with the following business requirements:

1. Posting functionality:

- Admin users can post leave credits to users and set expiration dates.

2. Utilization functionality:

- Users can use the available leave credits by filing for a Personal Time Off (PTO)

3. Deduction functionality:

- **Deduction due to utilization:** System will deduct used leave credits from the user's current total leave balance using first-in, first-out (FIFO) logic
- **Deduction due to expiration:** System will deduct leave credits when unused after expiration date from current total leave balance using first-in, first-out (FIFO) logic

Sample scenario:

- January 1:
 - Starting total leave balance: 0 hours
 - User earned 16 hours leave credits (posted by admin), set to expire after 60 days.
 - New total leave balance: 16 hours
- February 1:
 - User earned additional 16 hours leave credits, set to expire after 60 days.
 - New total leave balance: 32 hours (16 hours from January, 16 hours from February)
- February 2:
 - User filed for 8 Hours Personal Time Off for February 14
 - *Deduction due to utilization with FIFO logic:* System deducts 8 hours leave credits from January 1 earnings
 - New total leave balance: 24 hours (8 hours from January, 16 hours from February)
- March 2:
 - *Deduction due to expiration with FIFO Logic:* System deducts remaining unused leave credits from January 1 earnings due to 60 days expiration (8 hours)
 - New total leave balance: 16 (from February)
